# Decentralised Solar Power at Homes

- ▶ Solar PV gives DC Power
  - ▶ But load is AC
  - ▶ Needs a DC-AC convertor
- ▶ Now if we add a battery
  - ▶ Battery stores only DC
  - ▶ Require a AC-DC convertor for charging
  - ▶ Require a DC-AC convertor during discharging
- ▶ For low power, each convertor\* can have 10 to 15% loss
  - ▶ Solar with battery may have 25 to 45% loss

\* Solar DC-AC may have slight better efficiency

# And it gets worse

- ▶ As one realises that home-load is moving towards DC

<b>AC fan</b>	<b>72W</b>	<b>BLDC fan</b>	<b>30W</b>
at speed 1	60W		9W
<b>CFL tube</b>	<b>36W</b>	<b>LED tube</b>	<b>15W</b>
low intensity	na		4W

volume prices similar for fans

LED tube life much longer (DC powering enhances reliability)

- ▶ All Electronics devices work on low-voltage DC
  - ▶ TV (LED/LCD), laptops, Cell-phones, speaker-phones, tablets, speakers
    - ▶ AC to DC conversion has losses from 20% to 50% in each device
- ▶ Even the refrigerators, air-conditioners, washing machine in future will be BLDC motors
- ▶ Use of DC-powered and energy-efficient devices
  - ▶ Consumption **down by 50%**

# Move to **Solar-DC** at Home Premises

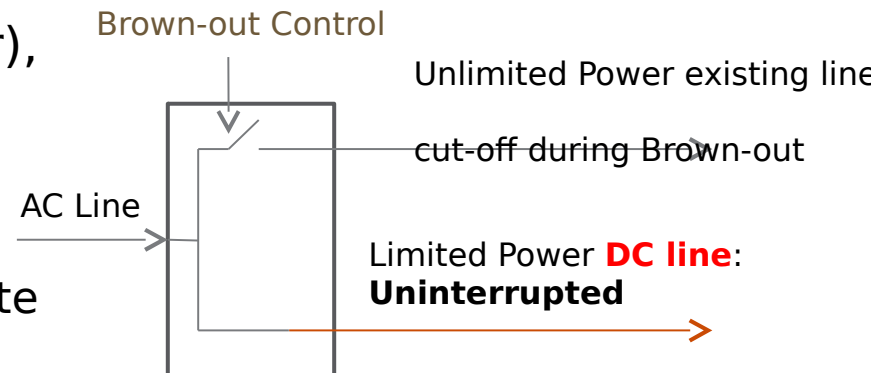

---

- ▶ 48V DC line as an additional power line at home
- ▶ **Highly power-efficient usage of Solar**
- ▶ Low-power from grid alone converted from AC-DC
  - ▶ Designed to have minimal loss
- ▶ Battery can be added with higher efficiency (no convertors), if required

# and the **Load Management Innovation**

- ▶ with the aim to Create a **PULL** for solar-DC and **Prevent** Black-out at homes
- ▶ Power shortage gets Discom to cut power (**black-out**) in select localities
- ▶ Introduce a **new power-level** for distribution to homes
  - ▶ **Brown-out**: low-amount power transmission -- say 10%
- ▶ Grid to supply **power on two lines at homes**
  - ▶ Existing AC **line** (unlimited power), but cut-off during **brown-out**
  - ▶ **A new DC** with **limited power**, but always ON
    - ON during **Normal + Brown-out** state

# But what will 10% DC Power do?

---

- ▶ Assume **uninterrupted but limited** Power: 100 Watts DC
  - ▶ enable three lights + 2 fans + cell-phone charging
  - ▶ or three lights + 1 fan + TV (24" LED/LCD) + cell-phone
    - ▶ can be installed incrementally
- ▶ 100W per home is small enough that it can be supplied even in adverse power situation
- ▶ **But what if one wants more?**
  - ▶ Add Solar PV
  - ▶ And if needed a battery to have a solar DC
  - ▶ 500W solar DC would support 5 fans, 8 lights, two TVs, multiple cell-phone / tablet chargers and a laptop charger

# But where is the pull to add solar and DC?

---

- ▶ Decentralised Solar can make huge difference
  - ▶ 240M homes: Avg 500W solar (50 sqft), will produce nearly
    - ▶  $240M \times 0.5 \text{ kw} \times 1600 \text{ solar hours a year} = 190,000 \text{ GWh per year}$
    - ▶ Close to total Domestic consumption in a year
- ▶ The UDC and Solar-DC approach Enables
  - ▶ No black-out in any home (without significantly burdening grid)
  - ▶ Create a consumer demand and Investment for DC appliances
  - ▶ And making decentralised Solar PV attractive for homes
  - ▶ Reduced domestic demand: energy-efficient appliances
  - ▶ Increase Supply as decentralized solar PV gets added
    - ▶ Reducing supply-demand gap
  - ▶ And at the same time have 24x7 DC power at each home
    - ▶ Adequate for LIH: Mid and high Income homes will install solar

# What is happening?

---

- ▶ Installations at homes, offices, labs at IITM
- ▶ UDC trials for 300 to 500 homes each at Chennai, Hyderabad, Trivandrum and Orissa
  - ▶ Chennai already ON
  - ▶ Ministry of Power POC in one town with 100K homes in 2015
- ▶ Off-grid Homes (OGH): 70 million homes
  - ▶ 25 home deployments in Nilgiris, Orissa, W. Bengal, Sricity and Telegana
  - ▶ Propose to install 100K off-grid homes
    - ▶ With the support of CSR, donations and 30% Government support
      - Need support from alumni
